
(a) Standard: vortex pairs shed by a moving beam
(b) Rotating, $\Omega = 0.7\,\omega$: vortex lattice
(c) Dipolar, $\varepsilon_{dd} = 2.4$: droplet crystal
(d) Two-component, $g_{12} = -1.3g$: quantum droplet
(e) Spin–orbit, $k_{so} = 2$, $\Omega = 4$: stripe phase
(f) Self-gravitating, $G = 0.2$: collapse to a solitonic core
(g) Polariton, $P = 2.5P_{th}$: pumped spot with vortices
(h) Thermal, $T = 13$: thermal vortex pairs
